

Data Sources & Provenance

OligoTox-Thrombocytopenia — every source, database and link behind the dataset

70 distinct sources · 1,959 measurements (1,453 human, 497 animal) · NIH/NCATS OligoTox Challenge, Phase 2

Every measurement in this dataset carries a `source_ref` and an exact `source_table` locus — the specific table, figure, claim or label section a value was read from. This document is **generated from the data**, so it cannot list a source the dataset no longer uses or omit one it does. For each entry: the full citation, the database it was retrieved from, a resolving link, the rights class governing reuse, the number of rows it contributed, and how many distinct loci within it were cited.

How to read the row counts. "Rows" is the number of per-measurement records drawn from that source; "loci" is the number of distinct places within it that were cited. A source with 387 rows across 268 loci was mined cell-by-cell, not summarised — the two numbers together show extraction depth.

Summary by database

Database	Retrieved via	Sources	Rows	Human
Peer-reviewed literature	europepmc.org · pmc.ncbi.nlm.nih.gov · doi.org	38	1,211	1,055
FDA — Drugs@FDA review documents	accessdata.fda.gov	12	271	201
EMA — EPAR assessment reports and SmPCs	ema.europa.eu	8	216	175
USPTO patents	patents.google.com	6	241	2
FDA — prescribing information (DailyMed)	dailymed.nlm.nih.gov	4	14	14
Trial registry	clinicaltrials.gov	2	6	6

Rights position across the dataset

Two separate questions, and this page answers only the second. (1) May the *source file* be republished? (2) May the *facts extracted from it* be reused? A measured value read out of a copyrighted table is not the table. This classification is about extracted-fact reuse; nothing here licenses republication of a source document.

Class	What it is	Position on extracted-fact reuse	Rows
public_domain_us_federal	US federal agency work	No copyright under 17 U.S.C. §105. Reproducible without restriction.	291
public_domain_uspto_patent	Granted US patent text	Patent specifications are published without copyright restriction. Reproducible; the patent CLAIMS remain enforceable as patent rights, which is a separate matter from copying.	241
ema_reuse_with_attribution	EMA document	NOT US public domain. EMA permits reuse, including commercial reuse, WITH attribution.	216
cc_permissive	CC-BY / CC0 article	Publisher-declared permissive licence. Values reproducible with attribution.	229
cc_nc_noncommercial	CC-BY-NC article	NonCommercial clause. Whether a prize submission is a commercial use is UNSETTLED and is not ours to decide; flagged, not assumed either way.	747
cc_nd_derivatives_restricted	CC-BY-ND article	NoDerivatives clause. Excluded from derived outputs.	11
closed_no_open_licence	No open licence located	PROPOSED HOLD pending the data owner's ruling. Zero rows withdrawn and zero rows cleared by this curation effort.	224

1,735 rows carry a publisher-declared or regulator-stated position permitting extracted-data release. **224 rows** are on **PROPOSED HOLD**: no open licence was located, and the ruling belongs to the data owner. **Zero rows withdrawn, zero rows cleared** by this curation effort — the holds are proposed, not applied.

This ledger is a project classification, not legal clearance. It records what each publisher or regulator declares, with the basis, so the position is auditable rather than asserted. A permissive classification is taken from the article's own licence field, never from the fact that it is free to read. Rights are tracked **per row**, so a consumer can filter to the records matching their own determination. The per-regulator split matters: **regulator document = government work = public domain reaches US federal agencies only**. EMA permits reuse with attribution, and other national regulators are more restrictive still — one forbids redistribution without written approval and another reserves all rights. Full per-row ledger: [curation/rights/shipped_row_rights.csv](#).

What is deliberately absent

No third-party full text is redistributed. Sources are referenced by identifier and exact locus; the PDFs and XML retrieved during extraction were working files and are not committed. What is committed is the curation record — every agent's returned rows, the adversarial-verification verdicts, and the source sweep — so the published tables are reproducible from their inputs rather than merely re-checkable against these citations.

Sources consulted but not used are not listed here. Two categories were deliberately excluded during curation: on-target antithrombotic pharmacology (aptamers that inhibit platelet function *by design* — that is the intended mechanism, not toxicity), and papers whose platelet content could not be pinned to a specific locus. A row whose exact locus could not be named was dropped rather than kept with a vague citation.
